

Making Telemedicine More Engaging

Increasing Presence and Attention for Medical Professionals and Patients

Kubi is a robotic tablet stand combined with a video feed that gives medical professionals and patients more engaging video calls. By allowing remote control of the tablet stand during a video call, caregivers can change their point of view to see everything in the patient room and interact with patients, nurses, and family members. Motion of the robot and high quality video provide more telepresence, meaning greater connection on the call.

Increasing the Number of Appointments by Reducing Travel Time

When Kubi is installed in multiple locations, medical professionals can simply “teleport” from one location to another. Kubi can also be mounted on medical carts which assistants or nurses can move between appointments without the physician. This system is superior to very costly roving robots which are not truly independent and often need assistance to move between locations.

Benefits of KUBI

- Affordable, easy, portable, dynamic remote care
- Minimize need for in-person visits
- Medical professionals can turn and pan to see details
- Interactions more engaging than conventional video calls

Details of KUBI

- Works any Video Conferencing App
- iOS, Android, and Windows tablets
- Connects with Bluetooth 4.0
- Removable base with standard tripod mount
- 4 hr onboard battery, USB and AC powered
